SUMMARY

Staff Platform Engineer & Technical Leader with 12+ years architecting production-grade cloud infrastructure, Kubernetes platforms, and CI/CD automation for Fortune 500 enterprises and high-growth startups. An early and fast adopter of AI engineering: in roughly six months at Doma, delivered platform scope normally measured in years — building agent-driven operations with Cursor cloud agents, LangGraph orchestration for complex multi-step loops, and custom agent plugins and skills adopted by the team. Proven track record delivering \$2M+ in annual infrastructure cost savings, achieving 99.8% platform uptime, and reducing deployment cycle times by 40–50%. Deep expertise in Terraform, Crossplane, Kubernetes (EKS/AKS/GKE), GitOps (ArgoCD/Flux), and observability (Prometheus/Grafana/Datadog). Trusted by organizations including Doma, Verizon, Sysco, and Citigroup to lead platform modernization, migrate legacy workloads to cloud-native architectures, and build self-service developer platforms that accelerate engineering velocity.

CERTIFICATION

- Kubestronaut (CNCF) - CKA, CKAD, CKS, KCNA, KCSA
- AWS Solutions Architect Associate
- CCNA
- HashiCorp Terraform Associate

SKILLS

- Kubernetes (EKS, AKS, GKE)
- Crossplane / Control Planes
- Terraform / Terragrunt / IaC
- AWS / Azure / GCP
- CI/CD (ArgoCD, GitHub Actions, CircleCI)
- Helm / Kustomize / OCI Charts
- Docker / Containerd
- Python / Go / Bash
- GitOps (ArgoCD, Flux)
- AI Agents / LangGraph
- Prometheus / Grafana / Datadog
- ELK Stack / Fluentd
- Vault / External Secrets
- Linkerd / Service Mesh
- Kafka / Event Streaming
- PostgreSQL / Redis / DynamoDB
- Linux / RHEL
- Ansible / Config Management
- Harbor / ACR / Artifactory
- Cost Optimization / FinOps
- SLO/SLI / Incident Management
- Microservices Architecture
- Platform Engineering
- Technical Leadership

EMPLOYMENT

Doma, Austin TX

January 2026-Present

Staff Platform Engineer

Lead platform architecture and infrastructure strategy for a high-growth organization, driving org-wide adoption of IaC, GitOps, and agent-driven self-service tooling. Own the design and delivery of scalable platform services across multi-cloud environments, establishing SLOs/SLIs and reliability standards that directly impact business outcomes.

Key Contributions:

- **AI Adoption & Delivery Velocity:** Compressed a multi-year platform roadmap into roughly six months by putting AI at the center of the workflow — Cursor cloud agents for automation, LangGraph for complex multi-step orchestration, and custom agent plugins and skills built for the team to use directly.
- **AI Agent Automation:** Packaged the platform team's core runbooks into Cursor cloud agents and reusable agent skills that create a cluster, bootstrap it with every required platform operations tool, and onboard applications onto it in one click — cutting cluster stand-up from 2–3 weeks of engineer time to under 4 hours (~95% reduction in lead time).
- **Agentic Developer Support:** Built support agents wired into Slack, Jira, live cluster state, and the Azure control plane, so engineers get answers on environments, deployments, and infrastructure in-channel instead of queuing behind a platform engineer.
- **Global Infrastructure Provisioning:** Provision infrastructure across multiple cloud accounts worldwide from centralized Crossplane control planes, with non-prod and prod hubs kept separate — giving every region the same governed golden path and removing per-account bespoke pipelines.
- **Centralized GitOps:** Consolidated deployments onto a centralized ArgoCD managing all clusters from a single control point, replacing per-cluster instances and giving one authoritative view of desired vs. live state across every environment.
- **Helm Standardization:** Replaced per-project Kustomize trees of 300+ overlay files with a common templated Helm chart published as an OCI artifact in the registry — a ~97% reduction to under 10 files per application, shifting deployment config from platform-only territory to something any developer can edit and ship safely.
- **Reinvested Capacity:** Redirected the ~200 engineer-hours/quarter freed by agent automation into self-service capability work — Crossplane compositions, golden-path templates, and paved-road tooling that let product teams provision and deploy without a platform ticket.
- **Production Cutovers:** Planned and executed cutovers of multiple production projects onto the new platform while carrying the on-call pager — sequencing each migration, validating rollback paths in advance, and completing them without service disruption.
- **Platform Architecture:** Architect distributed platform services across AWS, Azure, and GCP, supporting 50+ microservices with sub-100ms latency and 99.9% availability targets.
- **IaC & Automation:** Build and maintain 30+ reusable Terraform modules and self-service CI/CD pipelines (GitHub Actions, CircleCI, ArgoCD), reducing infrastructure provisioning time from days to under 15 minutes.
- **Observability & Reliability:** Define and implement SLOs/SLIs across 20+ services; deploy full observability stack (Prometheus, Grafana, ELK) reducing mean-time-to-detection (MTTD) by 60%.
- **Technical Leadership:** Mentor 10+ engineers across multiple squads on cloud-native and agentic engineering patterns; lead architecture design reviews, define org-wide standards, and author ADRs that accelerate team decision-making.
- **Cross-Functional Collaboration:** Partner with data engineering, SRE, security, and product teams to align platform roadmap with business objectives, unblocking 5+ engineering teams and accelerating feature delivery by 30%.

Clarity Innovations, Austin TX

April 2024-January 2026

Sr. Platform /Software Engineer

Served as lead platform engineer on a U.S. government contract, architecting and delivering a secure, production-grade Kubernetes platform under strict compliance and access controls. Drove the full platform modernization lifecycle from legacy VMware Tanzu PCF to containerized Kubernetes (EKS), while building CI/CD automation and observability tooling that accelerated team delivery velocity.

Key Contributions:

- **Platform Modernization:** Migrated 100% of backend services (15+ microservices) from VMware Tanzu PCF to Kubernetes EKS, eliminating legacy infrastructure dependencies and improving horizontal scalability by 3x.
- **Infrastructure Automation:** Engineered end-to-end CI/CD pipelines with ArgoCD and GitHub Actions, cutting release cycle times by 40% and enabling 10+ daily production deployments.
- **DevOps Enablement:** Integrated HashiCorp Vault with Kubernetes for centralized secrets management across 4 environments, eliminating manual credential rotation and reducing security incident surface.

SRI NAGARAM

- **Developer Productivity Tools:** Deployed SQLPad and CloudBeaver on Kubernetes, enabling 20+ developers to run ad hoc database queries via self-service web UI, reducing DBA ticket volume by 35%.
- **Common Helm Chart Development:** Authored a single reusable Helm chart adopted across 12+ application repositories, reducing deployment configuration drift by 80% and standardizing release processes org-wide.
- **Observability Enhancement:** Built production observability stack (Prometheus, Grafana, Fluentd, Alertmanager) providing end-to-end visibility across all services, reducing incident response time by 45%.
- **One-Click Solution:** Designed an “App of Apps” Helm pattern in ArgoCD, enabling one-command deployment of entire application stacks and reducing environment provisioning from 4 hours to 10 minutes.
- **Collaboration:** Delivered a production-hardened Kubernetes platform under government security protocols (no direct kubeconfig access), using ArgoCD for declarative GitOps deployments with full audit trails.
- **Build Optimization:** Built optimized multi-stage Docker images (layer caching, reproducible builds, multi-arch support), reducing image sizes by 60% and build times by 35%.
- **Cloud-Native Expertise:** Evaluated and implemented Redis cloud-native cluster solution, improving cache hit rates by 25% and reducing database load for high-traffic services.
- **Distributed ML / Workload Automation:** Automated build and test pipelines for distributed ML workloads on Kubernetes, achieving 90% pipeline success rate and reducing training environment setup time by 70%.

Sysco Labs, Austin TX

May 2022- March 2024

Sr. Platform /Software Engineer

Owned platform reliability and developer experience for Sysco’s flagship e-commerce platform (shop.sysco.com), managing Kubernetes infrastructure on AWS EKS for Java/Spring Boot microservices at enterprise scale. Led critical initiatives in secret management, canary deployments, and infrastructure cost optimization that directly impacted revenue-generating systems.

Key Contributions:

- Implemented Vault dynamic credentials with TTL-based rotation for production databases, reducing credential exposure risk by 90% and eliminating manual access provisioning workflows.
- Architected and operated microservices platform on AWS EKS with Docker and Helm, managing 30+ services and performing zero-downtime cluster upgrades across production environments.
- Implemented canary deployment strategy using Linkerd service mesh, Argo Rollouts, and Argo Workflows, enabling progressive rollouts that reduced production incident rate by 65%.
- Developed reusable Terraform modules and operational runbooks for scalability, HA, monitoring, backup, and disaster recovery, adopted by 4 engineering teams as standard practice.
- Deployed Vault dynamic credentials with TTL-based rotation for production PostgreSQL databases, cutting DB access provisioning time by 90% and strengthening compliance posture.
- Right-sized Kubernetes workloads via single-pod load testing methodology, identifying optimal CPU/memory thresholds and achieving \$150K+ annual cloud cost savings.
- Maintained 99.8% uptime for shop.sysco.com (enterprise e-commerce platform), supporting \$30B+ annual GMV with proactive incident management and automated failover strategies.

Technical Expertise:

- Core Stack: Terraform (IaC), Kubernetes (EKS), ArgoCD (GitOps), Linkerd (service mesh), Python/Bash (automation), Prometheus/Grafana (observability).
- Infrastructure Security: Achieved and maintained top-tier AWS Security Hub scores across 5+ accounts; built Python automation for anomaly detection and tag compliance enforcement.
- FinOps: Right-sized 30+ Kubernetes services using load-test-driven resource profiling, optimizing CPU, memory, and latency targets at peak throughput.

Nomi Health, Austin TX

October 2021-May 2022

Sr. DevOps /CloudOps Engineer

Led infrastructure delivery for a healthcare technology startup, provisioning multi-tenant AWS environments for client deployments. Drove Terraform modularization strategy that cut project delivery timelines in half, while building serverless architectures and CI/CD pipelines for rapid feature iteration.

Key Contributions:

- Designed and implemented reusable Terraform module library, reducing infrastructure provisioning turnaround time by 50% and establishing IaC standards adopted org-wide.
- Provisioned and automated AWS infrastructure for 10+ client environments (VPC, ECS, RDS, S3), ensuring compliant, repeatable deployments with zero-touch handoffs.
- Integrated Confluent Kafka with AWS infrastructure for event-driven data pipelines, improving data processing throughput and enabling real-time analytics for client platforms.

Projects:

- Led a 4-person infrastructure team through agile sprints, delivering all milestones on schedule while mentoring junior engineers on Terraform and AWS best practices.
- Designed multi-AZ, high-availability AWS architectures tailored to healthcare compliance (HIPAA), including VPC segmentation, encryption-at-rest, and audit logging.
- Built and maintained CI/CD pipelines with Terraform (HCL) as the single source of truth, enabling version-controlled infrastructure changes with automated plan/apply workflows.
- Deployed SonarQube on Kubernetes for automated code quality gates, integrating with CI pipelines to enforce static analysis standards across all deployments.

Achievements:

- Authored comprehensive infrastructure documentation and modular Terraform codebase, reducing onboarding time for new engineers from 2 weeks to 3 days.
- Architected serverless event-driven workflows using Lambda, SNS, SQS, S3, and API Gateway, processing 500K+ daily events with zero server management overhead.
- Delivered 100% of client infrastructure projects on time, earning repeat engagements and top satisfaction ratings through proactive communication and reliable execution.

W Energy Software, Tulsa, OK

July 2021-November 2021

Sr. DevOps Engineer

SRI NAGARAM

Managed AWS cloud infrastructure for an energy software company, supporting SaaS applications and databases serving upstream, midstream, and downstream oil & gas clients. Drove infrastructure-as-code adoption and initiated the containerization strategy to modernize legacy monolithic deployments.

Key Responsibilities:

- Deployed and automated client production systems on AWS (EC2, RDS, S3, CloudFront), maintaining 99.9% uptime SLA across all managed environments.
- Introduced CI/CD pipelines and authored containerization roadmap, building the business case for migrating monolithic applications to Docker/Kubernetes architecture.

Achievements:

- Refactored monolithic Terraform codebase into reusable modules, reducing infrastructure provisioning errors by 70% and enabling self-service environment creation.
- Delivered CI/CD pipeline proof-of-concept that demonstrated 60% faster release cycles, securing executive buy-in for container migration initiative.

Verizon, Irving, Texas

April 2019-July 2021

DevOps IV Engineer

Team Lead on Verizon's North Star Architecture (NSA) program, managing hybrid on-premises/AWS Kubernetes clusters supporting 200+ enterprise microservices in production. Led infrastructure capacity planning and performance optimization for high-traffic events including Apple iPhone launches, delivering measurable cost savings through data-driven right-sizing.

Key Contributions:

- Architected and managed Kubernetes CI/CD/CO production environments across hybrid infrastructure, supporting 200+ applications with automated deployment and rollback capabilities.
- Provided production release engineering support for 200+ enterprise services across multiple quarterly releases, maintaining zero critical deployment failures.
- Conducted Java application profiling and Kubernetes load testing for Verizon's Apple iPhone launch events, optimizing cluster capacity to handle 10x traffic spikes with zero degradation.
- Deployed and configured Confluent Kafka clusters with Snowflake and Lambda sink connectors, enabling real-time data streaming pipelines processing millions of events daily.

Achievements:

- Established production load testing framework: designed test scenarios, collected performance metrics at peak throughput, analyzed bottlenecks, and published capacity planning reports used by 8+ engineering teams.
- Delivered \$500K+ annual infrastructure cost savings by continuously right-sizing Kubernetes resource limits based on empirical load test data and usage patterns.
- Led Kubernetes cluster migration from on-premises to AWS EKS and executed 5 major version upgrades (1.16 to 1.24) with zero downtime, modernizing the entire container orchestration stack.

Citigroup, Irving, Texas

October 2017-April 2019

DevOps Engineer

Designed and delivered CI/CD solutions for 200+ application releases across multiple Citigroup business units, managing bi-weekly release cycles and CAB approval processes. Led hybrid cloud IaaS proof-of-concepts across AWS, GCP, and Azure, evaluating Kubernetes readiness for enterprise workload migration at one of the world's largest financial institutions.

Key Responsibilities:

- Led infrastructure planning and POC evaluations for 6+ Citigroup accounts, architecting hybrid cloud IaaS solutions that informed the enterprise-wide cloud migration strategy.
- Provisioned and hardened 100+ RHEL 6/7 VMs across vCenter and cloud environments, implementing security baselines and automated configuration management.
- Delivered multi-cloud POCs on AWS, GCP, and Azure, including bare-metal Kubernetes cluster installation and workload validation, producing technical recommendations adopted by leadership.
- Optimized VMware vSphere infrastructure and automated server provisioning workflows, reducing VM deployment time from 2 days to 4 hours.
- Built Python automation scripts for cloud cost reporting and data analysis, providing leadership with actionable FinOps insights that drove \$200K+ in annual savings.

EDUCATION

Purdue University, May 2017

Master of Science in Computer Information Technology

East Point College of Engineering and Technology, INDIA, May 2013

Bachelor of Engineering in Electronics and Communication
